```
The present sequence is that of a synthetic somatostatin analogue. The peptide can be used as component B in a claimed composition comprising a somatostatin analogue of formula (A-B), where A is Cys, or a peptide chain comprising one or more Cys residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring or synthetic somatostatin peptide, or its fragment, that binds to the somatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue(s) of component A by a thiol linkage. The drug is a therapeutic antianglogenic component A by a thiol linkage. The drug is a therapeutic drug such as a radioisotope, a cytotoxin, an immunostimulant, an antianglogenic agent. The somatostatin analogue preferably binds to SSTR-positive cells. The somatostatin analogue preferably binds to SSTR-positive cells. The somatostatin analogue in which a detectable label is bound to the Cys residue(s) of component A, and detecting the label. A claimed method for treating an SSTR-associated disorder comprises administering a somatostatin analogue in which a therapeutic agent is bound to the Cys residue(s) of component A. The SSTR cassociated disorder is especially cancer. Thiol-mediated drug attachment can also be used with other targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Somatostatin; acromegaly; radiolocalisation; blood-brain barrier; cancer;

                                                                                                            The invention provides for conventional somatostatin analogues (AAW48638-W48640 and AAW48664) and multi-tyrosinated analogues (AAW48641-W48645) with as the present one. The multi-tyrosinated somatostatin analogues bind to somatostatin receptors with practically the same affinity as thind to somatostatin. The somatostatin analogues are claimed to be useful for native somatostatin. The somatostatin, e.g. acromegaly. Also when cradioactively labelled, the analogues are claimed to be useful for adioactively labelled, the analogues are claimed to be useful for diagnosing cancer in vitro or in situ where aberrant expression of conditional somatostatin receptors with such high affinity that binding is nearly irreversible under physiological conditions. Therefore, by using radioactive halogenated analogues, the invention claims for improved sensitivity of radiolocalisation of the receptors. While to tyrosinated analogues have increased half-lives in vivo relative to conventional somatostatin analogues, are resistant to enzymatic

The condition is treated or prevented by administering to the mammal a somatostatin analogue. Also described is a pharmaceutical composition Woc-4D and carrier for treating or preventing retinopathy of prematurity in neonatal mammal. The somatostatin analogue is octreotide, Wor4D, somatostatin analogue having serum half-life of octreotide, somatostatin analogue having serum half-life of of octreotide, somatostatin analogue having serum half-life of Woc-4D. It is selected from octreotide, lanreotide, vapreotide, Woc-4D. Woc-5, or Woc-3B, Woc-3B, Woc-3B, Woc-5, or Woc-8. The invention provides a therapeutic benefit without affecting growth of the neonates. The present
                                                                                                                                                                                                                 Treatment or prevention of retinopathy of prematurity in neonatal mammal, comprises administering somatostatin analog having composition that provides therapeutic benefit to mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention provides for conventional somatostatin analogues (AAW48638-W48640 and AAW4664) and multi-tyrosinated analogues (AAW48645) was 640 and AAW46641 and multi-tyrosinated somatostatin analogues bind to somatostatin receptors with practically the same affinity as native somatostatin. The somatostatin analogues are claimed to be useful for treating disease associated with increased production of factors which can be regulated by somatostatin, e.g. acromegaly. Also when radioactively labelled, the analogues are claimed to be useful for radioactively labelled, the analogues are claimed to be useful for admonsting receptors is involved. When halogenated, these analogues are found to bind somatostatin receptors with such high affinity that binding is mearly irreversible under physiological conditions. Therefore, by using radioactive halogenated analogues, the invention claims for improved sensitivity of radiolocalisation of the receptors. Multi-improved sensitivity of radiolocalisation of the receptors. Multi-improved sensitivity analogues, are resistant to enzymatic conventional somatostatin analogues, are resistant to enzymatic degradation and have increased blood-brain barrier penetration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 somatostatin-dopamine chimeric analogue; cytostatic; antithyroid; vasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; anti-inflabetic; osteopathic; antidiacterial; immunomodulacor; hypertensive; tranquiliser; antilipaemic; nephrotropic; antiulcer; antiarthritic; hypotensive; anorectic; antidictive; dopamine receptor agonist; somatostatin receptor agonist; lung cancer; glioma; anorexia; accomegaly; restenosis; lung cancer; glioma; anorexia; acromegaly; restenosis; Crohn's disease; systemic solerosis; panoreatic pseudocyst; ascite; VIPoma; nesidoblastosis; hyperinsulinism; gastrinoms; Zolinger-Ellison Syndrome; diarrhoes; and singless of s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gastrinoma; Zollinger-Ellison Syndrome; diarrhoea; Alos related diarrhoea; scleroderma; Alos related diarrhoea; scleroderma; arritable bowel syndrome; pancreatitis; small bowel obstruction; irritable bowel syndrome; pancreatitis; small bowel obstruction; gastroesophageal reflux; duodenogastric reflux; Cushing's syndrome; gonadotropinoma; hyperparathyroidism; Graves disease; diabetic neuropathy; Paget's disease; polycystic ovary disease; thyroid cancer; hepatoma; leukaemia; meningioma; cancer cachexia; orthostatic; hypotension; postprandial hypotension; panic attack;
                                                                                                                                                                                                                                                                                                                                                      Multi-tyrosinated somatostatin analogues - useful for diagnosis and treatment of diseases related to altered somatostatin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Somatostatin-dopamine chimeric analogue-related peptide 45.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          80.0%; Score 64; DB 2; Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a dispersed phase formulation which comprises a biocompatible and biodegradable polymer, at least one nucleophilic substance capable of catalyzing ester bond cleavage and causing molecular weight reduction of the polymer, and acid additive in an amount such that the polymer is less susceptible to molecular reduction as compared to the formulation without the acid additive. The formulation of the invention is useful for preparing microspheres providing a sustained or controlled release of drug. This is useful for suppressing gonadotropin releasing hormmone in the treatment of testosterone dependent disorder, benign prostate hypertrophy or prostate cancer. The present sequence represents without has a mailed in a peptide which was contained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Somatostatin; acromegaly; radiolocalisation; blood-brain barrier; cancer;

4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methylsulfanyl-acetic acid. Optionally bound to 7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methyl-carbantc acid. Optionally bound to carbonic acid mono-(7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methyl) ester. Optionally bound to 4-(7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methyl) carbomyl) butyric acid. Optionally bound to 7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxylic acid. Optionally bound to 3-[1-(7-allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxylic acid. Optionally bound to 3-[1-(7-allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxylic acid. Optionally bound to 3-[1-(7-allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxyl)-3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarkhoeic, anti-inflammatory, antidarkhoeic, anti-InV, dermatological, anti-diabetic, osteopathic, antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, nephrotropic, antiulecr, antiartitic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexis, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal
GH secreting adenoma; acromegally; TSH secreting adenoma; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; prolafacania; insulin insensitivity; Syndrome; A; anglopathy; proliferative retinopathy; dawn phenomenon; nephropathy; gastric acid secretion; peptic ulcer; enterocutaneous fistula; pancreaticocutaneous fistula; dumping syndrome; watery diarrhoea syndrome; pancreatitis; gastrointestinal hormone secreting tumour; angiogenesis; arthritis; allograft rejection; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      somatostatin-dopamine chimeric analogs useful for the treatment of

prescribed procedures and actives, virtual, measurements. Described the prescribed distributes and actives, virtuals of related distributes, gastrinoma, Zollinger-Ellison Syndrome, distributes related distributes and construction, gastroseophageal reflux, duodenogastric reflux, Cushing's syndrome, gonadotrophinoma, hyperparathyroidism, Graves disease, thyroid cancer, hepstrom, leukaemia, maningioma, cancer cachexia, orthostatic, hypotension, postprandial hypotension, panic attacks, GH secreting adenomas, acomegally, TSH secreting adenomas, insulinoma, cancer cachexia, orthostatic, hypotension, postprandial hypotension, diabetes mellitus, hyperlipideemia, insulinoma, cancer caches mellitus, hyperlipideemia, insulinoma, cancer caches mellitus, hyperlipideemia, insulinoma, caches mellitus, hyperlipideemia, insulinoma insensitivity, Syndrome X, angiopathy, proliferative retinopathy, dawn phenomenon, caphropathy, gastric acid secretion, peptic ulcer, enterocutaneous fistula, pancreaticis, gastric acid secretinal hormone secreting tumour, candiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obesity and opicid overdose. The compounds simultaneously elicit dopamine receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.

the comprise at least one molety that binds to one or more sonatostating receptors and at least one molety that binds to one or more dopamine receptors and at least one molety that binds to one or more dopamine compositions, and therefore, specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin comparing that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasia and acromegaly as well as various neuroendorine tumours, vascular diseases e.g. sheumantoid arthritis, gastrointestinal tract disorders e.g. intermatedia arthritis, gastrointestinal tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g. hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic conclude cytostatic, osteopathic, antithyroid, vasotropic, antianglesic, continuidiammatory antidiamentodic antiantines.

Cantidiarrhoid; antitheumatic, antithyroid, vasotropic, antianglesic, antidialarrhoid, antidialarrhoid, antidialarrhoid, antidialarrhoid antidialarrho
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             somatostatin-dopamine chimeric analogue; cytostatic; antithyroid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarthoeic, anti-inflammatory, antidiarthoeic, anti-inflammatory, antibarcherial, immunomodulator, hypertensive, tranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Amino acid is Doc. Bound to 1-(7-ally1-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carbonyl)-3-ethylureidomethylsulfanyl acetic acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New somatostatin-dopamine chimeric analogs useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 watery diarrhoea syndrome; pancreatitis; gastrointestinal hormone secreting tumour; anglogenesis; arthritis; allograft rejection; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.

This invention relates to novel somatostatin-dopamine chimeric analogues

or their salts. The invention may be useful for the development of
compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory,
antidiarnhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic,
antidiarnhoeic, antil-HIV, dermatological, anti-diabetic, osteopathic,
antidiarnhoeic, antilucer, antiarthritic, hypotensive, anorectic or
antidactive activity through action as a dopamine receptor agonist and
compounds activity through action as a dopamine receptor agonist and
compounds activity through action as a dopamine receptor agonist

compounds activity through action as a dopamine receptor agonist

compounds activity through action as a dopamine receptor agonist

compounds activity through action as a dopamine receptor agonist

compounds activity through action as a dopamine receptor agonist

compounds activity through action as a dopamine receptor agonist

compounds. Helicobacter pylori proliferation, acromegaly,
restences Crowledcysts and ascites, Vipoma, partention granthora, granthora, pancreaticits, manll bowel obstruction, garrhoea, AIDS
related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable

compounds and ascites, vibring's syndrome, gonadorropinoma,
compounds and active facese, thyroid cancer, hepatoma, italiane

disease, polycystic overy disease, thyroid cancer, hepatoma, leukaemia,
dabetes mellitus, hyperilpidaemia, insulinoma,
serveting adenomas, prolactin secreting adenomas, acromegally, TSH
syndrome, x angiopathy, proliferative retinopathy, dawn phenomenon,
compound, diabetes mellitus, damping syndrome, watery diarrhoea
syndrome, pancreatitis, gastrointestinal hormone secreting tumour,
syndrome, x angiopathy, proliferative retinopathy, dawn phenomenon,
compounds, pancreatitis, allograft rejection, graft vessel bleeding,
coverdose. The compounds simultaneously elicit dopamine analogues
contain hypertension, gastrointestinal bleeding, obesity and opoid
coverdose. The compounds simultaneously el
                                                                                                                    /note= "Amino acid is Doc. Bound to 7-propyl-
4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-
methylsulfanyl-acetic acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New somatostatin-dopamine chimeric analogs useful for the treatment of

This invention relates to novel sometostatin-dopannia chimaric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarrhoeic, anti-inflammatory, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidicar inflammatory, antidiater of immunomodulator, hypotensive, tranquiliser, antidipaemic, copyrotropic, antidicer, antiarthitic, hypotensive, anorectic or antidiative activity through action as a dopamine receptor agonist and sometostatin receptor agonist. The invention may be useful for the creatment of lung cancer, gliome, anorexia, hypothyroidism, cancer, gliome, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, VIPome, nesidoblastosis, hypothyroidism, cancreatic pseudocysts and ascites, VIPome, nesidoblastosis, hyperinsulinism, gastrinoma, zollinger-Ellison Syndrome, diarrhoea, AIDS created diarrhoea, chemotherapy related diarrhoea, calcroderma, irritable copyreparathyroidism, Graves disease, diabetic neuropathy, pastrosophoma, cancer cachexia, orthoetatic, hypotension, postprandial coverting adenomas, prolatein, secreting adenomas, insulinoma, diabetes mellitus, hypotension, postprandial hypotension, diabetes mellitus, hypotension, postprandial compathy, dawn phenomenon, company, prolatering adenomas, insulinoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, Syndrome, andiopathy, proliferative retinopathy, dawn phenomenon, company, pancreatics, gestreinal, denomes, insulinoma, arthritis, allogarfit rejection, garfit vessel bleeding, control and pancreatics, percetting tumour, considered syndrome, pancreatics, percetting thermone secreting tumour, considered syndrome, pancreatics, allogarfit rejection, anglogatesis, arthritis, allogarfit rejection, approximation, pancreatics, placering hypotension, diabetes mellitus, hyperlipidaemia, and postprandial postprandial hypotension, diabetes mellitus, hyperlipidaemia, and postprandial postprandial postprandial p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
This invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    portal hypertension, gastrointestinal bleeding, obesity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with mchanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                          The present sequence is that of a synthetic somatostatin analogue. The peptide can be used as component B in a claimed composition comprising a somatostatin analogue of formula (A-B), where A is Cys, or a peptide chain comprising one or more (formula (A-B), which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring or synthetic somatostatin peptide, or its fragment, that binds to the somatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue(s) of component A by a thiol linkage. The drug is a therapeutic antiangiogenic agent, a therapeutic gene, or a chemotherapeutic antiangiogenic agent, a therapeutic gene, or a chemotherapeutic agent. The somatostatin analogue preferably binds to SSTR-positive cells, especially human cancer calls. A claimed method for detecting SSTR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                             positive cells comprises administering the somatostatin analogue in which a detectable label is bound to the Cys residue(s) of component A, and detecting the label. A claimed method for treating an SSTR-associated disorder comprises administering a somatostatin analogue in which a
                                                                                                                                                                                                                                                                                                                                                                                                                          therapeutic agent is bound to the Cys residue(s) of component A. The SSTR -associated disorder is especially cancer. Thiol-mediated drug attachment can also be used with other targeting peptides.
                                                                      A composition comprising a somatostatin analog useful for thiol-specific drug attachment to somatostatin and other targeting peptides, or for diagnosing or treating somatostatin receptor-associated disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     somatostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; anglogenesis; connective disease; scleroderma; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; opioid overdose; cytostatic; osteopathic; antithyroid; vasotropic; antiangiogenic; ophthalmological; antidabetic; dermatological; immunosuppressive; antiathritic; antirhumatic; antiinflammatory; antiulcer; antidathritic; antirhumanic; bepatotropic; antilipemic; analgesic; antianginal; anorectic; immunomodulator; cardiant; tranquillizer; antiaddictive; acromegaly; neoplasia; neuroendocrine tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /notes "An N-terminal dopamine derivative (Dop1 to Dop6 inclusive) is attached to a Lys (dopamine derivative) modified residue, where this second dopamine derivative must match the type occurring at the N-terminus, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
the comprise at least one moiety that binds to one or more somatostatin receptors and at least one moiety that binds to one or more somatostatin receptors and at least one moiety that binds to one or more dopamine or receptors and at least one moiety that binds to one or more dopamine or analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin creeptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasia and acromegaly as well as various neuroendocrine tumours, vascular diseases e.g. theumatoid arthritis, gastrointestinal crack disorders e.g. irritable bowel syndrome, metabolic diseases e.g. crack disorders e.g. irritable bowel syndrome, metabolic diseases e.g. chyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic disorder or an opicid overdose. Accordingly, they exhibit activities that include cytostatic, osteopathic, antilnflammatory, antilngangingenic, ophthalmological, antidiabetic, dermatological, immunosuppressive, antianginal, anorectic, immunomodulator, cardiant, tranquillizer and aniaddictive. This peptide sequence is a somatostatin-dopamine chimeric analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New chimeric analog comprising at least one moiety which binds to one or more sometostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease, immune disease and cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This invention relates to nover sometobrain-dopanine connected analogues or their salte. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidactric, osteopathic, antidacteria, immunomodulator, hypertensive, tranquiliser, antidipaemic, antidacteria, immunomodulator, hypertensive, tranquiliser, antidipaemic, antidacteria, immunomodulator, hypertensive, tranquiliser, antidipaemic, nephrotropic, antidictive activity through action as a dopamine receptor agonist and satisfactive activity through action may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, treatment of lung cancer, glioma, anorexia, hypothyroidism, creatments, Helicobacter pylori proliferation, acromegaly, referenosis, Crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, hyperinsulinism, gastrinoma, 20llinger-Ellison Syndrome, diarrhoea, hardmetherapy related diarrhoea, scleroderma, irritable comparathyroidism, graves disease, diabetic neuropathy, Paget's disease, polycystic ovary disease, thyroid cancer, hepatoma, leukaemia, cancer cachexia, orthostatic, hypotension, postprandial hypotension, panic attacks, GH secreting adenomas, insulinoma, cancer cachexia, orthostatic, hypotension, pastric cachexia, orthostatic, hypotension, pastric attacks, GH secreting adenomas, insulinoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, Syndrome X, anglopathy, proliferative retinopathy, dawn phenomenon, comphropathy, gastric cachexia, orthostatic, hypotension, pancreaticis, gastrician, dependents, and prince fistula, hyperlipidaemia, insulin insensitivity, carlight phancreaticis, gastrician, phanoresting tumour, completension, pancreaticis, allogarfit rejection, garfit vessel bleeding, or anglopathy, proliferative retinopathy, dawn phenomenon, can anglopathy, proliferative retinopathy, pastric day arthritis, allogarfit rejection, agraft vessel bleeding, or anglopathy carrierial hyp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          portal hypertension, gastroinrestinal bleeding, obesity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                  somatostatin-dopamine chimeric analogs useful for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 12;

cr their salts. The invention may be useful for the development of an inflammatory, antidarrhoed, antidator, hypertensive, tranquiliser, antilipaemic, antidatictly activity through action as a dopamine receptor agonist and somatoeratin receptor agonist. The invention may be useful for the comatoeratin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, connecting for the treatment of lung cancer, glioma, anorexia, hypothyroidism, connecting destruction, acromegaly, restendass, Crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and astites, viroliferation, acromegaly, restendass, chemotherapy related diarrhoea, sclerosophageal connecting diarrhoea, chemotherapy related diarrhoea, sclerosophageal reflux duodenogastric reflux, cushing's syndrome, gonadotropinoma, hyperparathyroidism, Graves disease, diabetic neuropathy, Paget's in thyperparathyroidism, Graves disease, diabetic neuropathy, paget's entinging, prolactin secreting adenomas, accomegally, TSH secreting adenomas, and propertion, panic attacks, GH secreting adenomas, and pastomas, insulinoma, glucagonoma, diabetes mellitus, hyperlighdaemia, insulin insensitivity, Syndrome x, anglopathy, proliferative retinopathy, dawn phenomenon, glucagonoma, diabetes mellitus, hyperlighdaemia, insulin insensitivity, syndrome, pancreaticocutaneous fishlad, dumping syndrome, watery diarrhoea syndrome, pancreaticocutaneous fishlad, dumping syndrome, watery diarrhoea syndrome, pancreaticocutaneous fishlad, permingional activity over the native somatosity and oppoid overdose. The compounds simultaneously elicit dopamine and dopamine and oppoid of all companions and permindian and dopamine and oppoid of all companions and permindianeously elicit was a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  wasotropic; anti-inflammatory; antidiarrhoeic; antithyroid;

e.g. lung cancer.

```
This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-lifaummatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antil-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antil-HIV, dermatological, anti-diabetic, osteopathic, antidiaddictive activity through action as a dopamine receptor agonist. The invention may be useful for the construction receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, creatment of lung cancer, glioma, anorexia, hypothyroidism, creatment of lung cancer, glioma, anorexia, hypothyroidism, creatment of lung cancer systemic sclerosis, external and internal pancreatic pseudocystes and ascites, Vilona, nesidoblastosis, hyperinsulinism, gastrinoma, Zollinger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroseophageal creflux, duodenogastric reflux, Cushing's syndrome, gonadotropinoma, chipsen, Graves disease, diabetic neuropathy, Paget's hyperparathyroidism, Graves disease, diabetic neuropathy, Paget's commingioma, cancer cachexia, orthostatic, hypotension, postprandial conformex, angiopathy, proliferative retinopathy, dawn phenomenon, concerting adenomas, insulinoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, Syndrome X, angiopathy, proliferative retinopathy, dawn phenomenon, comparative, pancreatics, gastrointestinal dumping syndrome, watery diarrhoea syndrome, pancreatitis, allongraft rejection, gastroines, suchritis, allongraft rejection, gastroines, arthritis, planding chemic observed the openion dastrointestinal homes excerting tumour, obstrial hyper-pansion, dastrointestinal homes excerting tumour, obstrial hyper-pansion, dastrointestinal hierages of pagetic discreting tumour, obstrial hyper-pag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Now succertural characteries and together of successful services and the successful services s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     somatostatin-dopamine chimeric analogue; cytostatic; antithyroid;

This invention relates to novel somatostatin-dopamine chimeric analogues

or their salts. The invention may be useful for the development of

compounds with a cytostatic, antithyroid, anti-diabetic, anti-liflammatory,
antidarrhoelc, anti-HIV, dermatological, anti-diabetic, osteopathic,
antidarrhoelc, anti-HIV, dermatological, anti-diabetic, osteopathic,
computed antidor, hypertensive, tranquiliser, antilipaemic,
nephrotropic, antidarthritic, hypotensive, anorectic or
antiaddictive activity through action as a dopamine receptor agonist and
commatostatin receptor agonist. The invention may be useful for the
treatment of lung cancer, glioma, anorexia, hypothyroidism,
creatment of lung cancer, glioma, anorexia, hypothyroidism,
creatment of lung cancer, glioma, anorexia, hypothyroidism,
creatment of lung dasase, systemic sclerosis, external and internal
pencreatic pseudocysts and ascites, VIPoma, nesidoblastosis,
creatmenting, gastrinoma, 20linger-Ellison Syndrome, diarrhoea, AIDS
related diarrhoea, chemotherapy related diarrhoea, scleroderma irritable
bowel syndrome, pancreatitis, small bowel obstruction, gastroesophageal
comparathyroidism, Graves disease, thyroid cancer, pepatoma, leukaemia,
chyperparathyroidism, Graves disease, thyroid cancer, pepatoma, leukaemia,
meningioma, cancer cachexia, orthostatic, hypotension, postprandial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /notem "Amino acid is Doc. Bound to 7-propyl-
4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-
methylsulfanyl-acetic acid"
orthostatic; hypotension; postprandial hypotension; panic attack; dH secreting adenoma; acromegally, TSH secreting adenoma; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; hyperlipideemia; insulin insensitivity; Syndrome X; andiopathy; proliferative retinopathy; dawn phenomenon; nephropathy; pastric acid secretion; peptic ulleer; enterocutaneous fistula; pancreaticocutaneous fistula; dumping syndrome; watery diarrhoea syndrome; pancreatitis; watery diarrhoea syndrome; percetitis; allograft rejection; graft vessel bleeding; portal hypertension; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New somatostatin-dopamine chimeric analogs useful for the treatment of

hypotension, panic attacks, GH secreting adenomas, acromegally, TSH secreting adenomas, prolactin secreting adenomas, insulinoma, glucagonomas, diabetes mellitus, hyperlipidaemia, insulinoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, syndrome X, angiopathy, proliferative retinopathy, dawn phenomenon, nephropathy, gastric acid secretion, peptic ulcer, enterocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatitis, gastrointestinal hormone secreting tumour, angiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertenaion, gastrointestinal bleeding, obesity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced aloinoidativity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           note= "D-form residue, optional tert-butyl modification"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic
               it is an example of populate agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents maintains the peptide's therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammancy bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and acromegaly. Peptide JF-08-87A has the ability to inhibit growth hormone release from primary cultures of rat pituitary cells, having an ICSO of colon (compared with 0.15 nM for somatostatin-14). Note: The present sequence is identified as SEQ ID 2 in the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   somatostatin-dopamine chimeric analogue; cytostatic; antithyroid; vasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; anti-diabetic; osteopathic; antibacterial; immunomodulator; hypertensive; tranquiliser; antilipaemic; nephrotropic; antiulcer; antiarthritic; hypotensive; anorectic; antiaddictive; dopamine receptor agonist; somatostatin receptor agonist; lung cancer; glioma; anorexia; hypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                              Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present sequence is that of somatostatin analogue peptide JF-08-87A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
/note= "optional epsilon-tert-butyloxycarbonyl modification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                      /note= "C-terminal amide, optional tert-butyl

This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, anti-diabetic, anti-lifammatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antidiarrhotic, hypertensive, tranquiliser, antilipaemic, computation antidiaddictive activity through action as a dopamine receptor agonist. The invention may be useful for the somatostatin receptor agonist. The invention may be useful for the creatment of lung cancer, glloma, anorexia, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal paractatic pseudocysts and ascites, Vipoma, needidoblastosis, of paractatic pseudocysts and ascites, Vipoma, needidoblastosis, orelated diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable reflux, duodenogastric reflux, Cushing's syndrome, gonadotropinoma, chyperparathyroidism, Graves disease, thyroid cancer, hepatoma, leukaemia, hyperparathyroidism, Graves disease, thyroid cancer, hepatoma, leukaemia, meningioma, cancer cachexia, orthostatic, hypotension, postprandial chypotension, panic attacks, GH secreting adenomas, insulinoma, compensative reting adenomas, prolactin secreting adenomas, insulinoma, compensative reting adenomas, prolactin secreting adenomas, insulinoma, compensative reting adenomas, prolactine reting adenomas, insulinoma, compensative reting adenomas, prolactine cacheting adenomas, insulinoma, compensative reting adenomas, prolactine cacheting adenomas, insulinoma, contraned cacheting cacheting adenomas, insulinoma, contraned cacheting cacheting adenomas, insulinoma, contraned cacheting cacheting adenomas fistula, dumping syndrome, warnersting cacheting adenomas fistula, dumping syndrome, and proper proper proper parefirmed and proper proper proper proper proper proper proper prop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "DOTA moiety or optional DOTA-O-benzyl or O-benzyl modification, D-form residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              syndrome, pancreatitis, gastrointestinal hormone secreting tumour, angiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obesity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "optionally modified with D-O-benzyl, D-form

The present sequence is that of a peptide analogue conjugate that is an active peptide agents of the invention that comprise a biologically active peptide, such as ematostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood
                                                                                                                                                                                                                                                                                                                                                                 /note= "optionally modified with 0-2,6- dichlorobenzyl"

The present sequence is that of a somatostatin analogue peptide. It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide so the biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and arthritis, neoplastic cells or aberrantly proliferating cells, and cromegaly. The present peptide has the ability to inhibit growth hormone release from primary cultures of rat pituitary cells, having an ICSO of 0.24 nM (compared with 0.15 nM for somatostatin-14)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     wasotropic; anti-inflammatory; antidiarrhoeic; antithyroid;

The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antiarthritic, hypotensive, ranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, treatment of lung cancer, glioma, anorexia, hypothyroidism, cromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites VIPoma, nesidoblastosis, hyperimalinism, gastrinoma, Zollinger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroesophageal reflux, duodenogastric reflux, Cushing's syndrome, gonadotropinoma, hyperparathyroidism, Garves diaease, diabetic neuropathy, Paget's disease, polycystic ovary disease, thyroid cancer, hepatoma, leukaemia, meningioma, cancer cachexia, orthostatic, hypotension, panic attacks, GH secreting adenomas, acromegally, TSH
                                                                                                                                              /note= "D-form residue. Optionally bound to 7-propyl-46,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methylsulfamyl-acetic acid. Optionally bound to 7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methyl-carbamic acid. Optionally bound to carbonic acid mono-(7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methyl) ester. Optionally bound to 4-((7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methyl) carbomyl) butyric acid. Optionally bound to 7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxylic acid. Optionally bound to 3-(1-(7-allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxylic acid. Optionally bound to 3-(1-(7-allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinollin-9-carbonyl)-3-ethylureidopropyl)-Gly-"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              somatostatin-dopamine chimeric analogs useful for the treatment of

or their sales. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarhoeic, anti-INV, dermatological, anti-diabetic, osteopathic, antidarhoeic, anti-INV, dermatological, anti-diabetic, osteopathic, antidactive activity through action as a dopamine receptor agonist and sentenced action as a dopamine receptor agonist and sentenced in the invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, cromegaly, restenced, crohin's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, hybothyroidism, cromegaly, related diarrhoea, chemotherapy related diarrhoea, irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroesophageal reflux, dundencyststic reflux, Cushing's syndrome, ganarhoea, irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroesophageal reflux, dundencystic ovary disease, thyroid cancer, hepatoma, leukaemia, meningloma, cancer cachexia, orthostatic, hypotension, postprandial maningloma, panic attacks, disease, thyroid cancer, hepatoma, leukaemia, meningloma, cancer cachexia, orthostatic, hypotension, postprandial secreting adenomas, prolactin secreting adenomas, insulin insensitivity, glucagonoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity,
                                                  figgranolin-9-carboxylc acid. Optionally bound to 1-(7-ally1-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carboxylc acid. Optionally bound to 1-(7-ally1-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carbonyl) -3-ethylureidopropyl) carbamic acid. Optionally bound to carbonic acid mono-(3-(1-(7-ally1-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carbonyl) -3-ethylureidopropyl) carbamic acid. Optionally bound to octahydroindolo[4,3-fg]quinolin-9-carbonyl) -3-ethylureidoppropyl) carbamic acid. Optionally bound to 3-(1-(7-ally1-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-
                                                                                                                                                                                                                                                                       fglquinolin-9-carbonyl) -3-ethylureidopropyl)-Gly-.
Optionally bound to 4-(3-(1-(7-allyl-4,6,6a,7,8,9,10,10a-
octahydroindolo[4,3-fg]quinolin-9-carbonyl)-3-

           nephropathy, gastric acid secretion, peptic ulcer, entercontaneous fistula, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatitis, gastrointestinal hormone secreting tumour, angiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obesity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                           Gaps

Misc-difference 2
  The present sequence is that of somatostatin analogue peptide JF-08-73.

It is an example of peptide agents of the invention that comprise a bologically active peptide, such as somatostatin or bombeain, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, untoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and arcomegally. Peptide JF-08-73 was used in an examination of the buddistribution of hydrophilic peptide agents. A lack of accumulation of biodistribution of the peptide agents. A lack of accumulation of the present sequence is identified as SEQ ID 11 in the disclosure (page 14), but it is not the same as the sequence given as SEQ ID 11 in the disclosure the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                              Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "N-terminal 3-N,N-dimethylaminobenzoic acid moiety, D-form residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present sequence is that of a somatostatin analogue peptide. It is an actample of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be arreatly an expensive the peptide has the ability to inhibit growth hormone acromegaly. The present peptide has the ability to inhibit growth hormone release from primary cultures of rat pituitary cells, having an ICSO of

The present sequence is that of a somatostatin analogue peptide. It is an example of peptide agents of the invention that comprise a blologically active peptide, such as somatostatin or bombeain, conjugated to a chemical compound through a minter that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of anglogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

peptide can be used as component B in a claimed composition composition composition be used as component B in a claimed composition composition a somatostatin analogue of formula (A-B), where A is Cys, or a peptide chain comprising one or more Cys residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring somatostatin peptide, or its fragment, that binds to the somatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue(s) of component A by a thiol linkage. The drug is a therapeutic arresidue(s) of component A by a thiol linkage. The drug is a therapeutic arresidue(s) of component A by a thiol linkage. The drug is a therapeutic antiangiogenic, a therapeutic gene, or a chemotherapeutic agent.

The somatostatin analogue preferably binds to SSTR-positive cells. The somatostatin analogue is a claimed method for detecting SSTR-positive cells. A claimed method for treating an SSTR-positive cells and to the Cys residue(s) of component A, and detecting the label. A claimed method for treating an SSTR-associated disorder comprises administering a somatostatin analogue in which a therapeutic agent is bound to the Cys residue(s) of component A. The SSTR associated disorder is especially cancer. Thiol-mediated drug attachment can also be used with other targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ï
                                                                                                                                                                                                                                                                                                                                                  A composition comprising a somatostatin analog useful for thiol-specific drug attachment to somatostatin and other targeting peptides, or for diagnosing or treating somatostatin receptor-associated disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 somatostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; angiogenesis; connective disease; scleroderma; immune disease; rheumatoid arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; opioid overdose; cytostatic; osteopathic; antithyroid; vasotropic; antiangiogenic; ophthalmological; antichamatori, dermatological; immunosuppressive; antiarthritic; antirheumatic; antiinflammatory; antiulcer; antidiarthoenic; hepatotropic; antilipaemic; antilipaemic; antidiarthoeic;

New chimeric analog comprising at least one moiety which binds to one or more sometostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease, immune disease and cachexia.

Claim 12; Page 115; 138pp; English.

This invention relates to novel somatostatin-dopamine chimeric analogues that comprise at least one moiety that binds to one or more dopamine creceptors and at least one moiety that binds to one or more dopamine creceptors and at least one moiety that binds to one or more dopamine creeptors at leaved thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic conditions to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin creceptor subtypes that are accordingly associated with the treatment of particular diseases that are accordingly associated with the treatment of particular diseases that are accordingly such a various neuroendocrine to treat neoplasia and acromegaly as well as various neuroendocrine tumours, vasular diseases e.g. rheumatoid arthritis, gastrointestinal tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g. hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic disorder or an opioid overdose. Accordingly, they exhibit activities that include cytostatic, osteopathic, antithyroid, vasotropic, antiangiogenic, ophthalmological, antidiabetic, dermatological, immunosuppressive, antidiarrhoelc, nephrotropic, hepatotropic, antilipaemic, analgesic, antianginal, anorectic, immunomodulator, cardiant, tranquillizer and antiaddictive. This peppide sequence is a somatostatin-dopamine chimeric analogue of the invention.

Accordingly, they exhibit activities that include expostatic, osteopathic, antithyroid, vasorropic, antiangiogenic, ophthalmological, antidabetic, dermatchordi, mannosuppressive, antidarthritic, antirheumatic, antiinflammatory, antiulcer, antidatesic, antiangingunomodulator, cardiant, tranquillizer and antiandinal, anorectic, immunosublator, cardiant, tranquillizer and antiaddictive. This peptide sequence is a somatostatin-dopamine chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        attached to a Lys(dopamine derivative) modified residue, where this second dopamine derivative must match the type occurring at the N-terminus, i.e. Dop2-Lys(Dop2). Optionally Lys can be a D-form residue."
                             that comprise at least one moiety that binds to one or more somatostatin receptors and at least one moiety that binds to one or more dopamine receptors, or a salt derived thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin receptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasia and acromegaly as well as various neurondocrine
invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           vascular disease; angiogenesis; connective disease; scleroderma; immune disease; rheumatoid arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; popiod overdose; cytostatic; osteopathic; antithyroid; vasotropic; antiangiogenic; ophthalmological; antidiabetic; dermatological; immunosuppressive; antidiarthotic; antirheumatic; antiinflammatory; antiuloer; antidiarthoeic; nephrotropic; heblactropic; antilipaemic; analgesic; antianginal; anorectic; immunomodulator; cardiant; tranquillizer; antiaddictive; acromegaly; neoplasia; neuroendocrine tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /label= OTHER

This invention relates to novel somatostatin-dopamine chimeric analogues
that comprise at least one moiety that binds to one or more somatostatin
creceptors and at least one moiety that binds to one or more dopamine
receptors or a salt derived thereof. Specifically, it refers to
analogues that may be used in vitro or in vivo for research, diagnostic
and therapeutic agents to enhance the activity of somatostatin and
dopamine i.e. working as receptor agonists. The present invention
consideration as receptor agonists. The present invention
cecribes analogues with specificity for different types of somatostatin
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor subtypes that are accordingly associated with the treatment of
creceptor immune diseases e.g. rheumatoid arthritis, gastrointestinal
crace disorders e.g. irritable bowel syndrom, metabolic diseases e.g.
chyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic
disorder or an opioid overdose. Accordingly, they exhibit activities that
clicked cytostatic, osteopathic, antihyroid, vasotropic, antiangiogenic,
contiantharitic, antifieumatic, antiinflammatory, antiulcer,
antiandinal, anorectic, immunomodulator, cardiant, tranquillizer and
antiandiumical anivention.
                                                                                                                                                                                                                                                                                                                                                                                     New chimeric analog comprising at least one moiety which binds to one or more somatostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease,
                                                        'note = This disulphide bond cyclises the peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB 8; Length 11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 61; DB Pred.                         acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF have been synthesised. The present sequence is one such analogs denoted JF-05-43. These analogs may be used as an antineoplastic therapeutic, specifically targeted to angiogenic blood vessels or cells. Angiogenic blood vessels or cells. Angiogenic blood vessels carled which are involved in human diseases, such as psoriasis, protective retinopathy and diabetes-related blindhess, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs can be used to selectively kill a neoplastic cell expressing a somatostatin receptor. The analogs are also useful for imaging cells expressing a receptor to which the analogs useful for imaging cells expressing a receptor to which the analogs useful for imaging cells expressing a receptor to which the analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that

Novel analogs of SRIF wave been synthesised. The present sequence is one such analog, denoced JF-06-45. These analogs may be used as an antineoplastic therapeutic, specifically targeted to anglogenic blood vessels or cells. Anglogenic blood vessel cells which are involved in human diseases, such as psoriasis, protective retinopathy and disbetes-related blindness, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs can be used to selectively kill a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neoplastic cell expressing a somatostatin receptor. The analogs are also useful for imaging cells expressing a receptor to which the analog specifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Somastatin analogs useful for the treatment of neoplastic cells expressing somastatin receptors and targeting angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

<u>.,</u>

This invention relates to novel somatostain-dopamine colmers analogues or their sails. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antibacterial, immunomodiator, hypotensive, tranquiliser, antilipaemic, antibacterial, immunomodiator, hypotensive, tranquiliser, antilipaemic, antibacterial, immunomodiator, hypotensive, anorectic or antiadictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, creatmonism, Helicobacter pylori proliferation, acromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, hyperinaulinism, gastrinoma, Zollinger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable cover syndrome, pancreatitis, small bowel obstruction, gastrosphageal reflux, duodenogastric reflux, Cushing's syndrome, gonadorropinoma, hyperparathyroidism, Gaves disease, diabetic neuropathy, gastrosphageal coversia, orthostatic, hypotension, postprandial cancer cachexia, orthostatic, hypotension, postprandial coverting adenomas, acromegally, TSH secreting adenomas, diabetes mellitus, hypotension, postprandial cancer, hepatoma, diabetes mellitus, hypotension, pastric cachexia, orthostatic, hypotension, pancreatitis, gastrointestinal hormone secreting tumour, nephropathy, gastric cachexia, orthostatic, paperic ulcer, enterocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatitis, allograft rejection, graft vessel bleeding, coverdose the compounds simultaneously elicit dopamine receptor agonist effects in vivo with enhanced controlleding, pancreating reflexing escreting tumour, and somatostatin receptor squarcatic semansomine secreting activity cover the parise semansomine secreting and somatostenting reflexing semansomine secreting populations and somatostat wasorropic; anti-inflammatory; antidarrhoeic; anti-HIV; dermatological; wasorropic; anti-inflammatory; antidarrhoeic; anti-HIV; dermatological; wasorropic; anti-diabetic; neteopathic; antidactrial; dimmunomodulator; hypertensive; tranquiliser; antidarthritic; my tranquiliser; antidarthritic; my tranquiliser; antidarthritic; my tranquiliser; anorectic; antiaddictive; dopamine receptor agonist; my somatostatin receptor agonist; lung cancer; glioma; anorexia; hyperaldosteronism; Helicobacter pylori proliferation; acromegaly; restenosis; Crohn's disease; systemic sclerosis; my pancreatic pseudocyst; sacite; VIRoma; neathoblastosis; pastrinoma; Zollinger-Ellison Syndrome; diarrhoea; scleroderma; my sellison Syndrome; diarrhoea; scleroderma; riritable bowel syndrome; pancreatitis; small bowel obstruction; my astroesophageal reflux; dodenogastric reflux; Cushing's syndrome; gonadocropinoma; hyperparathyrolism; Graves disease; w diabetic neuropathy; Paget's disease; polycystic ovary disease; ö This invention relates to novel somatostatin-dopamine chimeric analogues biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention. Gaps ö Somatostatin-dopamine chimeric analogue-related peptide 54. Score 59; DB 7; Length 10; Pred. No. 0.49; 0; Mismatches 1; Indels ADI14943 standard; peptide; 11 AA. This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasorropic, anti-filammatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antider, hypertensive, tranquiliser, antilipaemic, compiniotropic, antiuler, antimicer, antiatritici, hypertensive, anoretici or antiaddictive activity through action as a dopamine receptor agonist. The invention may be useful for the antisaddictive activity through action as a dopamine receptor agonist. The invention may be useful for the comatostatin receptor agonist. The invention may be useful for the comatostatin receptor agonist. The invention may be useful for the comatostatic pentions, Helicobacter pylori proliferation, acromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal components. The pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, solventions, distributed diarrhoea, scleroderma, irritable comparathyroidism, gastrioraspath, small bowel obstruction, gastroesophageal reflux, duodenogastric reflux, Cushing's syndrome, gonadorropinoma, chyperparathyroidism, Graves disease, diabetic neuropathy, Paget's disease, polycystic ovary disease, thyroid cancer, hepatoma, leukaemia, /note= "Amino acid is Doc. Optionally bound to 7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-methylsulfanyl-acetic acid. Optionally bound to 3-(1-(7-ally)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carbonyl)-3-ethylureidopropyl)-Gly-" orthogratic; hypotension; postprandial hypotension; panic attack; GH secreting adenoma; acromegally; TSH secreting adenoma; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; hyperlipidaemia; insulin insensitivity; Syndrome X; angiopathy; proliferative retinopathy; dawn phenomenon; nephropathy; gastric acid secretion; peptic ulcer; enterocutaneous fistula; pancreaticocutaneous fistula; dumping syndrome; watery diarrhoea syndrome; pancreatitis; agstrointestinal hormone secreting tumour; angiogenesis; arthritis; allograft rejection; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose. New somatostatin-dopamine chimeric analogs useful for the treatment of /note= "Residue forms a bond to residue 5 to form a /note= "Residue forms a bond to residue 10 to form cyclic peptide" thyroid cancer; hepatoma; leukaemia; meningioma; cancer cachexia; (SCRC) SCRAS SOC CONSEILS RECH & APPL SCI. /note= "C-terminal amide" Moreau J; 'note= "D-form residue" 'note= "D-form residue" Location/Qualifiers Claim 3; Page 139; 85pp; English. cyclic peptide" Kim SH, 08-JUN-2001; 2001US-0297059P. 07-JUN-2002; 2002WO-US017859 Dong ZX, WPI; 2003-239103/23 e.g. lung cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
              hypotension, panic attacks, GH secreting adenomas, accomegally, TSH secreting adenomas, insulinoma, glucagonomas, prolactin secreting adenomas, insulinoma, glucagonoma, diabetes mellitus, hyporlipidaemia, insulinoma, glucagonoma, diabetes mellitus, hyporlipidaemia, insulinoma, syndrome, x, angiopathy, proliferative retinopathy, dawn phenomenon, nephropathy, gastric acid secretion, peptic ulcer, enterocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatics, gastrointestinal hormone secreting tumour, angiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obesity and opicid overdose. The compounds similaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced allone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analog, denoted

VF-05-81. These analogs may be used as an antineoplastic therapeutic, blood vessels or cells. Angiogenic blood vessels or cells. Angiogenic blood vessels or cells and seases as as as psoriasis, protective retinopathy and diabetes-related blindness, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs act by inhibition of growth hormone neoplastic cell expressing a sometostatin receptor. The analogs are also useful for imaging cells expressing a receptor to which the analog succifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Somastatin analogs useful for the treatment of neoplastic cells expressing somastatin receptors and targeting anglogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, somatostatin, SRIF, neuropeptide, antineoplastic, psoriasis, protective retinopathy, diabetes-related blindness.

The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analog, denoted JF-06-57. These analogs may be used as an antineoplastic therapeutic, specifically targeted to angiogenic blood vessels or cells. Angiogenic blood vessel cells which are involved in human diseases, such as psoriasis, protective retinopathy and diabetes-related blindness may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs act by inhibition of growth hormone neoplastic cell expressing a somatostatin receptor. The analogs are neoglastic cell expressing a receptor to which the analog specifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; somatostatin; SRIF; neuropeptide; antineoplastic; psoriasis;

Somastatin analogs useful for the treatment of neoplastic cells

```
ö
                                                       The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analog, denoted JF-05-44. These analogs may be used as an antineoplastic therapeutic, specifically targeted to angiogenic blood vessels or cells. Angiogenic blood vessels or cells. Angiogenic blood vessels, protective retinopathy and diabetes-related blindness, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs act by inhibition of growth hormone neoplastic cell expressing a somatostatin receptor. The analogs are nespilated for imaging cells expressing a receptor to which the analog superificially binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
expressing somastatin receptors and targeting angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, somatostatin, SRIF, neuropeptide, antineoplastic, psoriasis, protective retinopathy, diabetes-related blindness.
                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                          73.8%; Score 59; DB 3; Length 12; 81.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                            acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF arolog of angiogenic blood vessels or cells. Anglogenic blood vessels or cells. Anglogenic blood vessels or cells. Anglogenic blood vessels cells which are involved in human diseases, such as psoriasis, protective retinopathy and diabetes-related blindhess, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs can be used to selectively kill a neoplastic cell expressing a somatostatin receptor. The analogs are also useful for inaging cells expressing a receptor to which the analogs specifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                                                                                                 The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that
                                                                              Somastatin analogs useful for the treatment of neoplastic cells expressing somastatin receptors and targeting angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                       acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF have been synthesised. The present sequence is one such analogs denoted of F-05-59. These analogs may be used as an antineoplastic therapeutic, specifically targeted to angiogenic blood vessels or cells. Angiogenic blood vessel cells which are involved in human diseases, such as psoriasis, protective retinopathy and diabetes related blindness, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs can be used to selectively kill a neoplastic cell expressing a somatostatin receptor. The analogs are also useful for imaging cells expressing a receptor to which the analog specifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                                                                                                    the human somatostatin (SRIF) peptide, is an endogenous neuropeptide that
Somastatin analogs useful for the treatment of neoplastic cells expressing somastatin receptors and targeting anglogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "optional methotrexate-acetyl moiety, D-form

                                                                                                                                                                                                                                                                                                                                                       유
                                                                                                              The present sequence is that of somatostatin analogue peptide JF-07-100.

It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical activity. The peptide almost also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, treating tumours of the lung, breast, brain, eye, prostate, or colon, treated are inflammatory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and acromegaly. Peptide JF-07-100 has the ability to inhibit growth hormone cromegase from primary cultures of rat pituitary cells, having an ICSO of compared with 0.15 nM for somatostatin-14). Note: The present sequence is identified as SRQ ID 1 in the sequence listing
                                                                                                                                                                                                                                                                                                                                                          ö
                                        ogically active peptides such as somatostatin or bombesin conjugated nemical compounds through linkers, useful for treating tumors of the and breast, carcinoid syndrome, and tumors of anglogenic blood
                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF specifically targeted to angiogenic blood vessels or cells. Angiogenic blood vessels or cells which are involved in human diseases, such as sportasts, protective retinopathy and diabetes-related blindness, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs act by inhibition of growth hormone neoplastic cell expressing a somatostatin receptor. The analogs are neoplastic cells expressing a receptor to which the analog specifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                             Somastatin analogs useful for the treatment of neoplastic cells expressing somastatin receptors and targeting angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; somatostatin; SRIF; neuropeptide; antineoplastic; psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                    The human somatostatin (SRIF) peptide, is an endogenous neuropeptide that acts as a regulator of growth hormone secretion. Novel analogs of SRIF have been synthesised. The present sequence is one such analogs of SRIF of 0.5-05. These analogs may be used as an antineoplastic therapeutic, specifically targeted to angiogenic blood vessels or cells. Angiogenic blood vessel so relies, protective retinopathy and diabetes-related blindness, may also be targeted. The SRIF analogs act by inhibition of growth hormone release. Radiolabelled analogs act by inhibition of growth hormone release. Radiolabelled analogs act by inhibition of growth hormone useful for imaging cells expressing a receptor to which the analogs specifically binds. This may be used for tumour localization. Analogs with multiple tyrosine residues have the advantage that they are hydrophilic, which allows tumours in the liver to visualised
                                                                                                                                                                                              Somastatin analogs useful for the treatment of neoplastic cells expressing somastatin receptors and targeting angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gastric acid secretion; peptic ulear; enterocutaneous fistula; pancreaticocutaneous fistula; dumping syndrome; watery diarrhoea syndrome; pancreatitis; gastrointestinal hormone secreting tumour; angiogenesis; arthritis; gastrointestinal hormone secreting tumour; angiogenesis; arthritis; gastrointestinal bleeding; obesity; opioid overdose.

This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of cor their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-lifammatory, antidarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidarrhoeic, antilicar, hypertensive, tranquiliser, antilipaemic, compounds antilicar, antilitarthitic, hyperensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the somatostatin receptor agonist. The invention may be useful for the complexity in grancer, glioma, anoraxia, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, restenois, Grohn's disease, systemic sclerosis, external and internal hyperinsulinism, gastrinoma, Zollinger-Ellison Syndrome, diarrhoea, AlDS related diarrhoea, chemotherapy related diarrhoea, diarrhoea, chemotherapy ralated diarrhoea, scleroderma, irritable reflux, duodenogastric reflux, Cushing's syndrome, gonadotropinoma, hyperparathyroidism, Graves disease, diabetic neuropathy, Pagget's chapter ovary disease, thyroid cancer, hepatoma, leukaemia, hyperparathyroidism, Graves disease, diabetic neuropathy, paget's creflux, dubences mellitus, hyperlipidaemia, insulinoma, accomeration, date accepting adenomas, insulinoma, accepting adenomas, proliferation secreting adenomas, insulinoma, gliomapathy, gastric acid secretion, peptic ulcer, enterocutaneous consputy, proliferative retinopathy, dawn phenomenon, chistula, pancreatics, angiopathy, proliferatinal hormone secreting tumour, gyndrome, pancreaticis, gastrointestinal hormone secreting tumour, syndrome, pancreaticis, gastrointestinal hormone secreting contaneous gyndrome, pancreaticis, gastrointestinal bleeding, obesity and opioid
                                                                                                                  /note= ". Optionally bound to 7-propyl-
4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-
methylsulfanyl-acetic acid. Optionally bound to 3-(1-(7-
allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin
-9-carbonyl)-3-ethylureidopropyl}-Gly-"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  somatostatin-dopamine chimeric analogs useful for the treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel somatostatin agonists, typically characterised by alkylation of the amide nitrogen, or its pharmaceutically acceptable salt. The novel somatostatin agonists are useful for binding one or more of human somatostatin subtype receptors 1,-2,-3,-4 and -5, and for eliciting a somatostatin agonist effect, by administering a somatostatin agonist effect, by salt of it to a recipient in need of it. The somatostatin agonists are useful for treating a disease or condition in a human or other animal, including Cushing's syndrome, gonadotropinoma, hyperparathyroidism, paget's disease, VIPpoma, nesidioblastosis, hyperinsulinism, gastrinoma, Zollinger-Bilison syndrome, (AIDS) and other conditions, irritable bowel
